Angular Assignment
Rent-hub

Rent-hub

In today's fast-paced world, finding and renting an apartment can be a complex and time-consuming process. Prospective renters often face challenges in locating suitable listings, while landlords and property managers struggle to connect with potential tenants efficiently. There is a need for a seamless, user-friendly platform that allows users to post available apartments for rent, express interest, and engage in discussions.

Requirements

Develop a web-based application that serves as a comprehensive platform for apartment rentals. The application should enable users to:

1. **Post Apartments for Rent**: Landlords and property managers can create detailed listings for available apartments, including descriptions, photos, rental terms, and contact information.
2. **Show Interest:** Prospective renters can express their interest in specific listings by marking them as favourites or sending inquiries.
3. **Comment and Reply:** Both landlords and prospective renters can engage in discussions through a commenting system, allowing users to ask questions, provide additional information, and negotiate rental terms.

Key Features

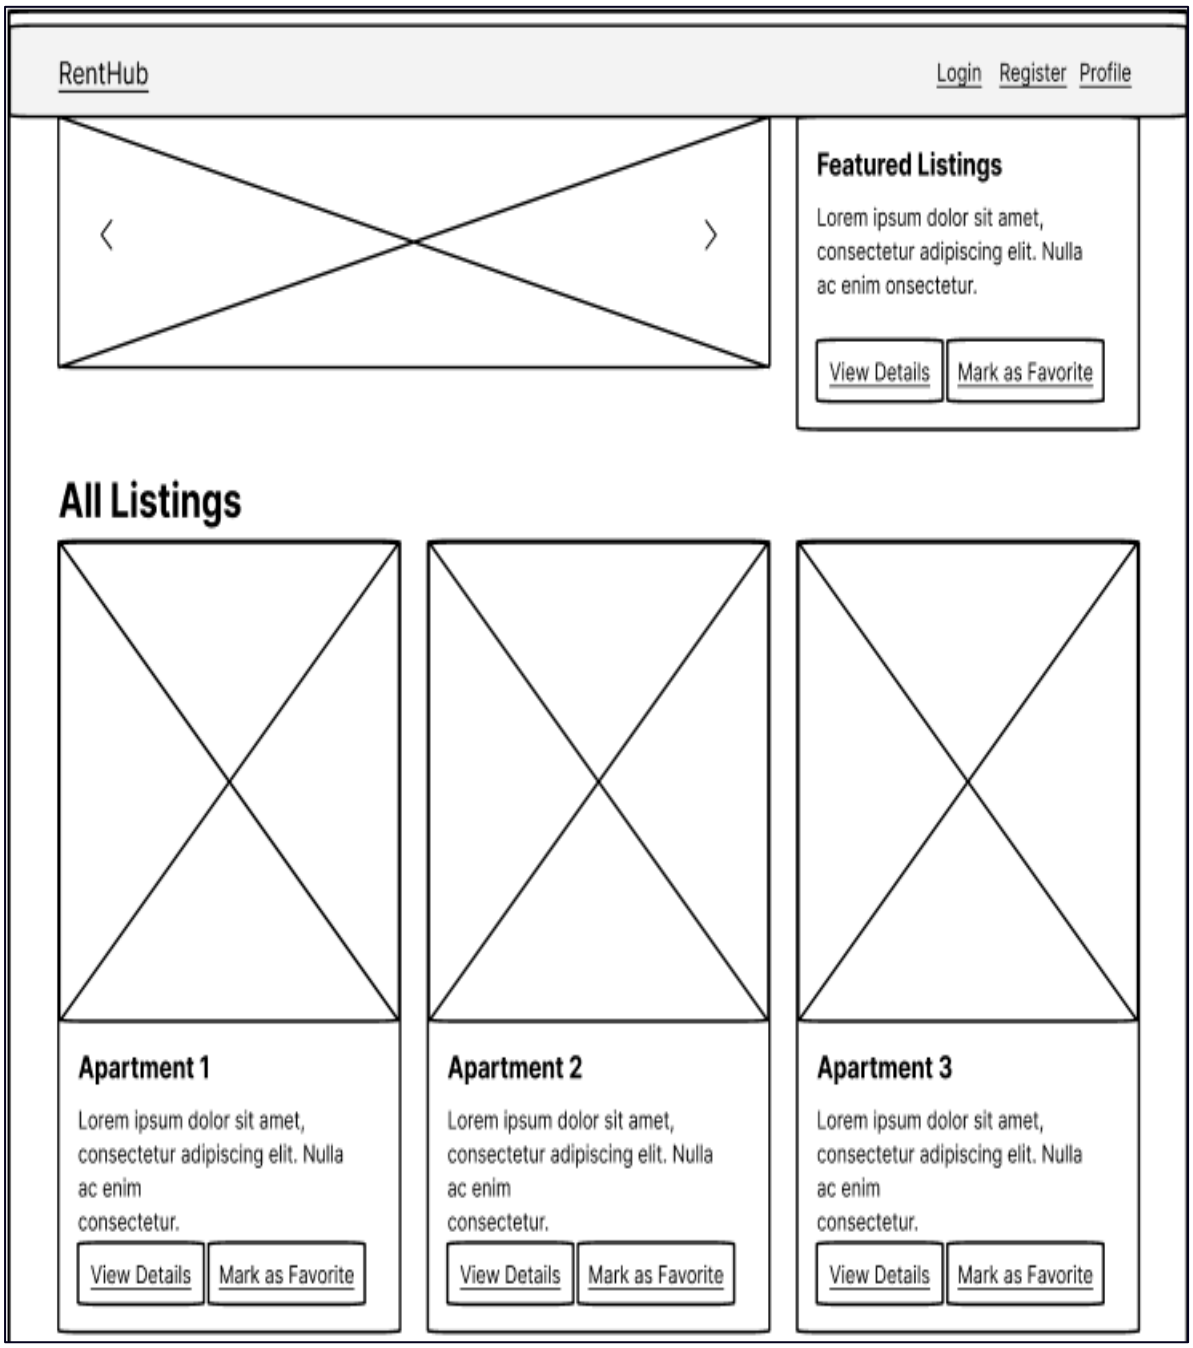

1. **User Registration and Authentication:** Secure user accounts with registration and login functionalities to ensure only authorized users can post listings and comments.
2. **Apartment Listings:** A robust system for creating, updating, and managing apartment listings, including essential details such as location, price, amenities, and photos.
3. **Comments:** An interactive comment section for each listing where users can ask questions, leave feedback, and respond to comments, fostering transparent communication.
4. **Search and Filter:** Advanced search and filtering options to help users find listings that match their specific criteria, such as location, price range, and amenities.

Screens/Wireframes:

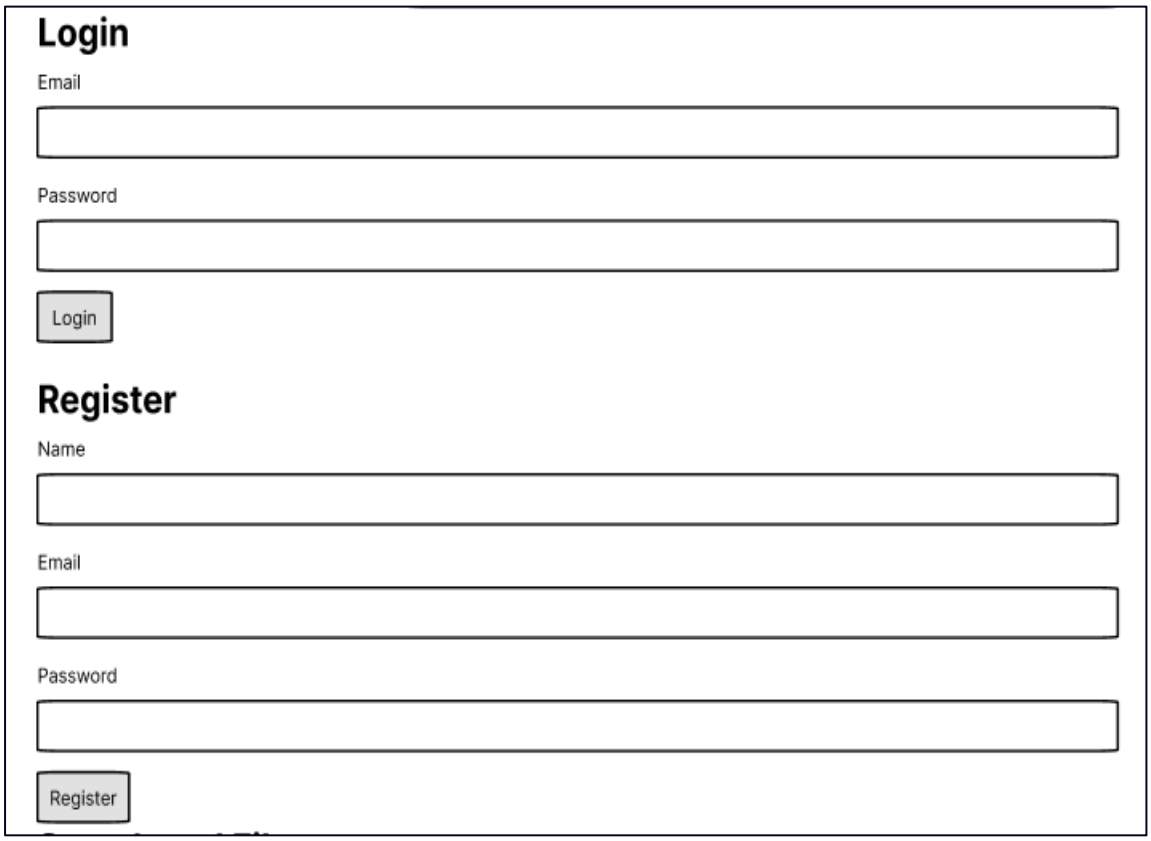

Home Screen: It features a carousel at the top for showcasing highlighted listings and a paginated listing section for easy navigation through all available entries. Users can sort listings by various criteria and quickly access detailed information. Quick Actions i.e. View details and mark as Favourites.

Interest Expression: Features for users to mark listings as favourites or send direct inquiries to landlords, enabling easy communication of interest.

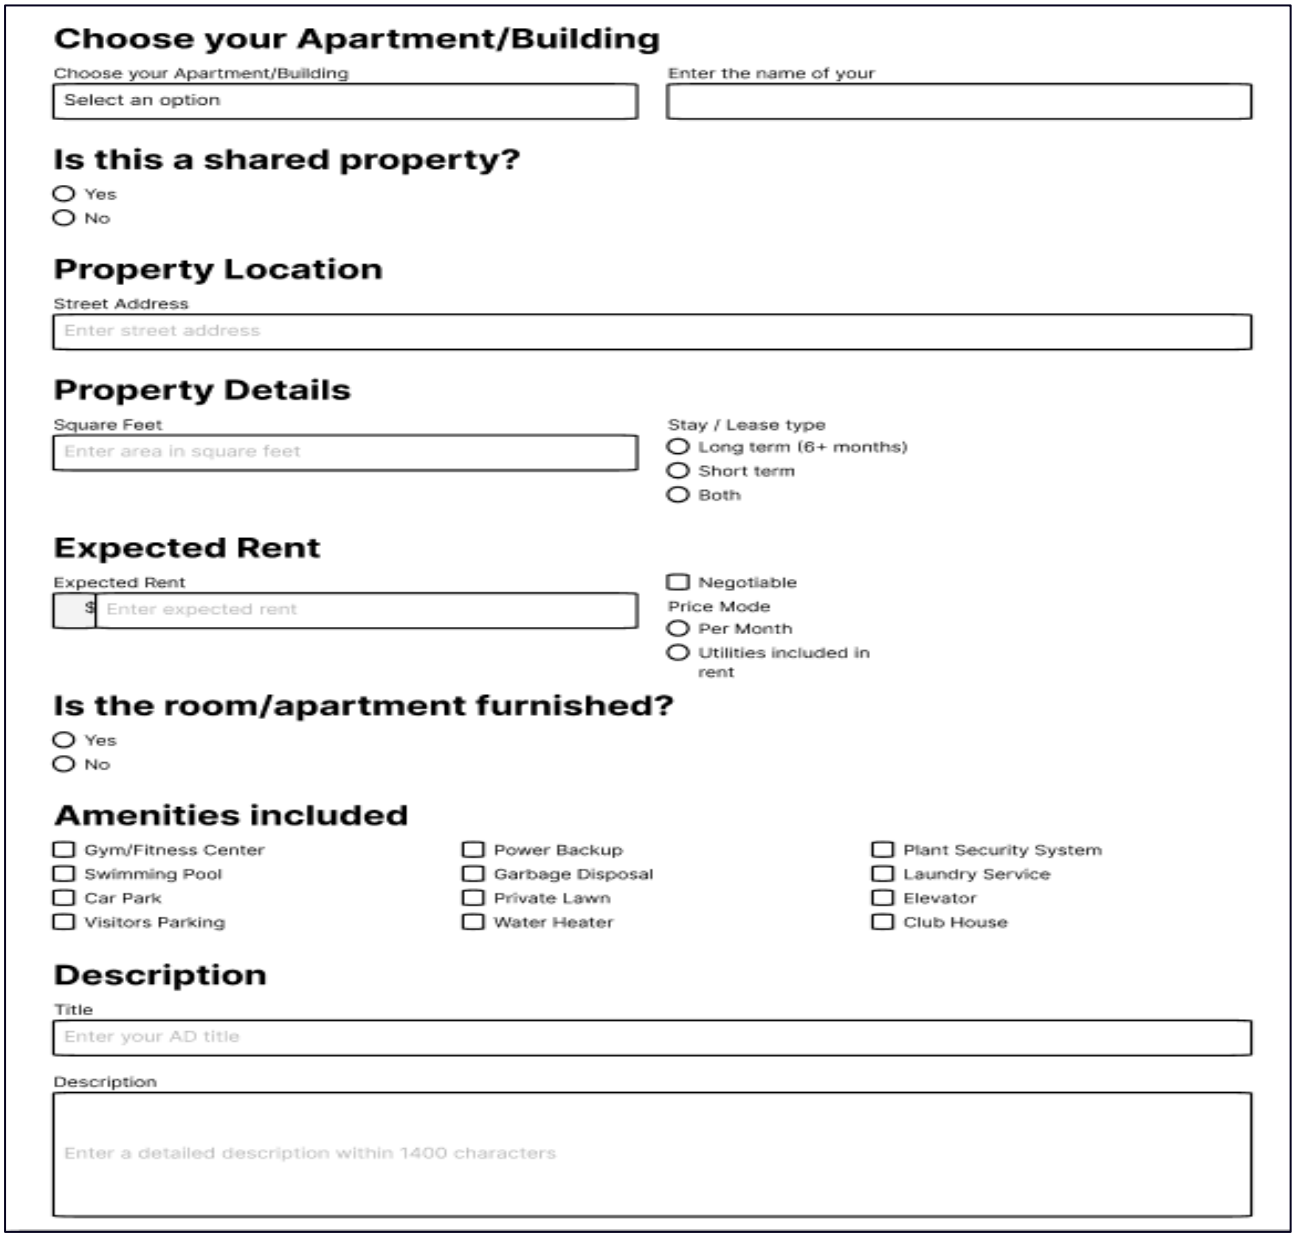

Search and Filter on Home Screen: Advanced search and filtering options to help users find listings that match their specific criteria, such as location, price range, and amenities.

User Sign Up Form: Form to collect basic information of user.

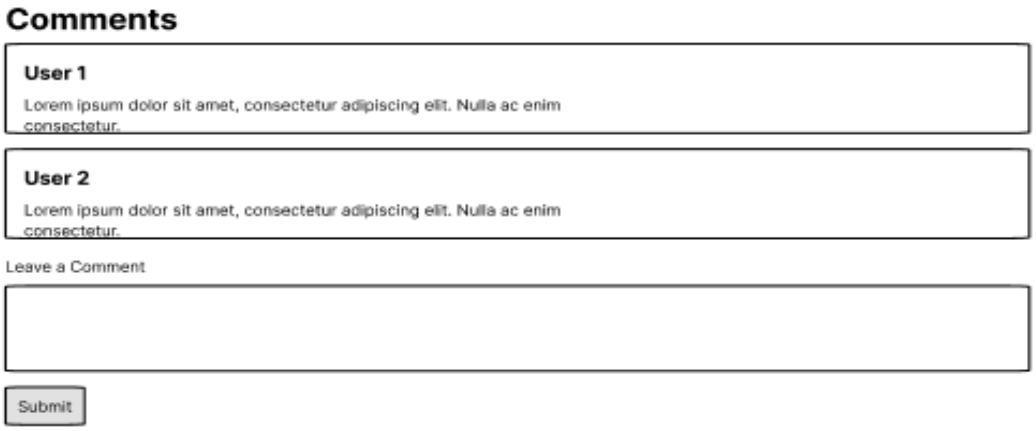

Create New Post: Form to collect property information, contact details, and additional information like whether the room/apartment is furnished, included amenities (as checkboxes), and vegetarian preference (radio buttons).

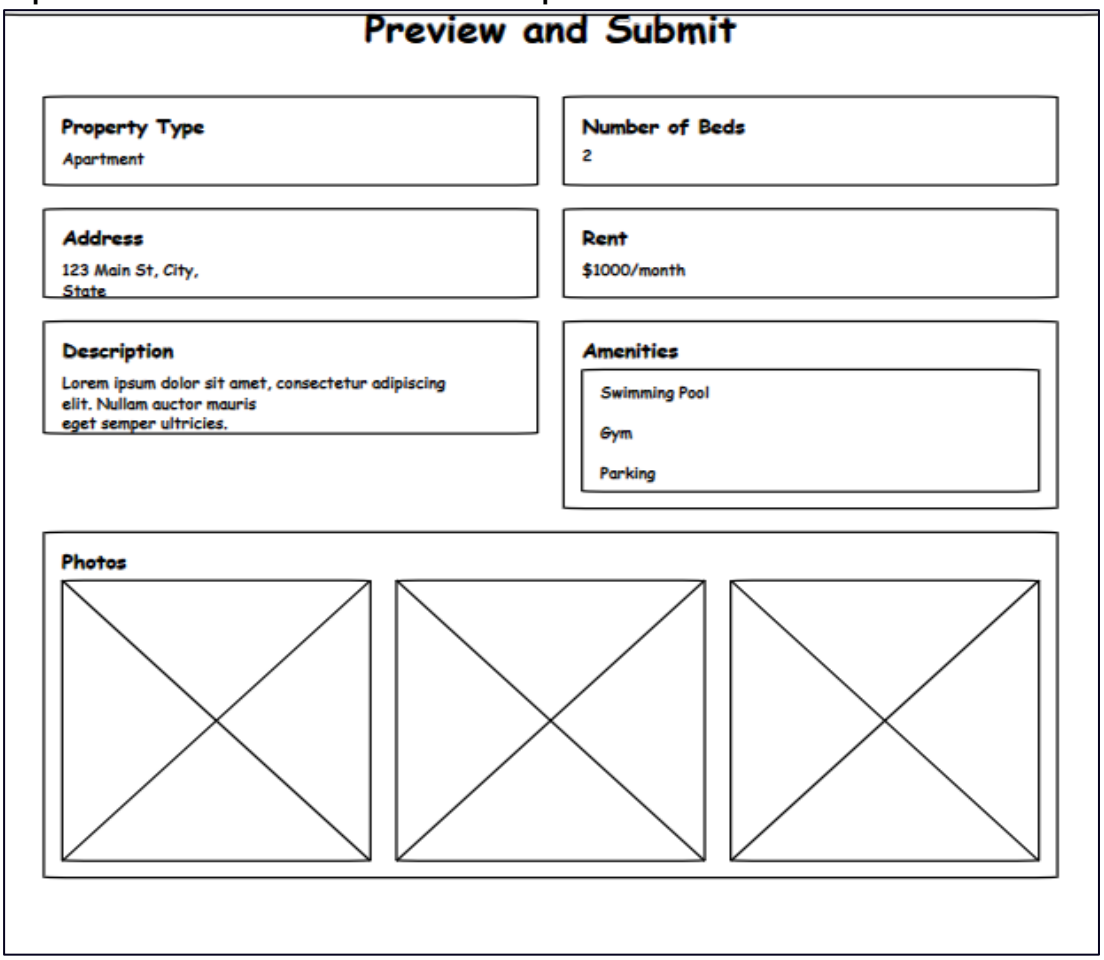

Note: Please Add Form Validation Wherever Applicable.

View Details: Show Details of Post, Option to add comments on a post.

Bonus Questions:

- **Implement Preview and Submit Screen for post.**

Deliverables

- A fully functional web application meeting the specified requirements.
- Write unit test cases for at least 1 component, service and module.
- GitHub link where code is kept (without node modules)
- Link for deployed application. (Note: Deploy the frontend application on any free hosting providers)
- README file where the above two links are kept along with user credentials
- If attempted the bonus points, do mention it in readme.

Evaluation Criteria

- Application Deployed
- Auth Guards
- Routing Implementation
- Form validation
- Ease of using application
- Library for CSS
- Code Quality and best practises
- Bonus points for attempting good to have features

Note

- Please update your angular cli to the **latest version** release.
- use creative thinking to enhance the UI interface and functionality of the platform. This includes Intuitive and Responsive Design
